

Enhanced Usability For Decentralized Wallets As Atomic Wallet Joins FIO

Decentralized wallet for atomic swaps joins interoperability drive in a move that will facilitate crypto usability and increase adoption

DENVER, CO — 13 August 2019: Atomic Wallet, the decentralized multi-currency wallet that uses atomic swaps, has joined the [Foundation for Interwallet Operability \(FIO\)](#) in a move to increase convenience for existing crypto users and accelerate mass adoption of cryptocurrencies. As the newest member of FIO, [Atomic Wallet](#) joins a consortium of 24 other leading wallets and exchanges in the crypto ecosystem, including Enjin Wallet, Binance's Trust Wallet, BRD Wallet, ShapeShift, MyCrypto, Edge Wallet and Coinomi Wallet.

"Atomic Wallet is honored to join FIO in its mission for crypto usability. We are excited for a decentralized, cross-platform service that will help make lives much easier and more convenient for crypto users, and we're delighted to be joining such an impressive array of projects in helping achieve mass adoption." said Konstantin Gladych, CEO of Atomic Wallet.

The FIO Protocol is a decentralized service layer that enables several major usability features across any blockchain, token or coin. This includes functionality that puts an end to the need for a 64-character gibberish alphanumeric string to transfer crypto, integrated request for payment workflow that virtually eliminates errors when sending crypto, and standardized metadata that provides context for the purpose of a transaction. Future roadmap items include subscription billing, multi-signature routing for security and cross-wallet data visibility.

"It is great to welcome Atomic Wallet as the newest member of the Foundation for Interwallet Operability. This project is working to ensure crypto users can securely store and exchange coins and tokens in a decentralized manner. Its mission to make life easy for users is totally in sync with our own mission to make moving coins and tokens easier and less risky, and we look forward to the insights and strategic support they can provide," said David Gold, Founder and CEO of Dapix, the team behind the protocol's development.

Atomic Wallet is a universal cryptocurrency wallet with decentralized atomic swap exchange. Released in 2018, it now supports any ERC20 and BEP2 tokens with around 100 - 200 cryptocurrencies in a default list, and is available across all major operating systems, including Windows, macOS, Ubuntu, Fedora and Debian.

Atomic Wallet's decentralized Atomic Swap Exchange allows users to proceed with cross-chain exchanges while avoiding third party risks. Its strong encryption and custody-free solution means that private keys are encrypted and never leave a user's device. As it is a decentralized solution, users do not need to engage with platforms that require AML/KYC checks, thereby preserving their anonymity.

FIO sits alongside all other blockchains providing a decentralized layer of messaging, communication, and workflow about the sending of value on those blockchains. FIO does not send crypto value—it makes

the sending of value on any blockchain better. Additionally, FIO is not a wallet—it enables all wallets to be safer and more user-friendly.

Crypto wallets, exchanges, and payment processors can learn more about the Foundation and the benefits of becoming a member by visiting <https://fio.foundation/>.

About FIO Protocol:

The Foundation for Interwallet Operability (FIO) is a consortium of leading wallets, exchange, and crypto payment processors supporting the FIO Protocol -- a decentralized Service Layer that removes the risk, complexity, and inconvenience of sending and receiving tokens and coins identically across every blockchain. The FIO Protocol is not a wallet and does not compete with other blockchains, rather, it makes the user experience better across every wallet and every blockchain.

About Atomic Wallet:

Atomic Wallet is a decentralized multi-currency wallet for built-in atomic swaps. It supports over 500 coins and tokens, and is available across all major operating systems, including Windows, macOS, Ubuntu, Fedora and Debian. It is also available for download in the Apple and Google Play stores. Atomic Wallet's decentralized Atomic Swap Exchange allows users to proceed with cross-chain exchanges while avoiding third party risks. Its strong encryption and custody-free solution means that private keys are encrypted and never leave a user's device.
